Note on data for previous years

Numbers in this document listed for past years may not match totals in previous reports. Totals may increase due to late reports, and may decrease when duplicate reports are eliminated or cases are subsequently identified as out of our jurisdiction.

In addition, disease rates may have changed due to updated denominator data from the U.S. Census Department.

Technical Note

All graphs, tables and maps in this report were produced using SAS for Windows version 9.4. The document itself was created with *Microsoft Word*.

Preface

Abbreviations used in this report include the following:

A/YA	Adolescents and young adults
SFHN.....	San Francisco Health Network (formerly "Community Health Network" in this report)
CC/CBO	Community Clinic/Community-Based Organization
CHPY	Community Health Programs for Youth
CT.....	Chlamydia
GC	Gonorrhea
IDU	Injecting drug user
MSM.....	Men who reported sex with men only (past year); also men whose reported sexual orientation is "Gay" if partner data unavailable
MSMW.....	Men who report having sex with men and women (past year); also men whose reported sexual orientation is "Bi-sexual" if partner data unavailable
MSW.....	Men who report having sex with women only (past year); also men whose reported sexual orientation is "Straight" or "Heterosexual" if partner data unavailable
OMI.....	Oceanview, Merced, Ingleside
OOJ	Out of jurisdiction
P&S	Primary and secondary syphilis
PMD	Private medical doctor
ZSFG.....	Zuckerberg San Francisco General Hospital and Trauma Center

I. Reported Morbidity

Sources of data

Title 17 of the California Administrative Code requires all clinicians treating or knowing of a patient with a suspected or documented reportable sexually transmitted disease (STD) and all laboratories with a test result or isolate suggesting infection by a reportable agent of an STD to report their findings to the patient's local health department. In 2017 the list of reportable STDs included syphilis of any stage, gonorrhea, chlamydia, and chancroid. Reports of morbidity must include the patient's name and address and demographic information (gender, age, and race or ethnicity). As recommended by the United States Centers for Disease Control and Prevention (CDC), gender of sex partners has been a required reportable item in San Francisco, since July 2004.

Previous reviews of the San Francisco STD surveillance system suggest that reporting is nearly complete for syphilis, gonorrhea and chlamydia when a diagnostic test was performed in a laboratory. However, many individuals with STDs are never diagnosed with a laboratory-based test, either because they do not develop symptoms, are presumptively treated, or are not screened appropriately by their provider, or have no access to health care. Furthermore, demographic data are often missing from reports; in 2018, approximately 17 percent of all gonorrhea and chlamydia reports lacked information on race or ethnicity. For these reasons, reported totals should be considered minimal estimates of the true number of STDs in the community.

Disease rates

Rates have been listed in most tables along with reporting totals. Rates are equal to the number of STD cases within the specified population per 100,000 San Francisco residents in that population per year.

Rates should be used when comparing STD levels among different populations, as differences in disease totals are affected by the size of the population as well as incidence.

Comparison rates for other areas are from *Centers for Disease Control and Prevention. Sexually Transmitted Disease Surveillance 2018. Atlanta: U.S. Department of Health and Human Services; 2018*. In these figures, "San Francisco MSA" represents data for the entire San Francisco-Oakland-Hayward MSA.

Reporting sources

The two clinics mentioned most frequently in this report are City Clinic and Magnet Clinic at Strut. The San Francisco City Clinic is the only municipal STD clinic in San Francisco, operated by the San Francisco Department of Public Health (SFDPH). Much more information about City Clinic is presented in Section III below.

Supported in part by the SFDPH, Magnet is an innovative health promotion center in the Castro District of San Francisco that provides a variety of clinical and social services with expertise in the sexual health needs of gay, bisexual and other MSM in San Francisco and throughout the Bay Area.

Census data

Population denominators for disease rates are based on 2010 US Census Data, except for congenital syphilis, where live birth totals for each year (reported by the SFDPH Office of Vital Records) are used instead.

Data on race or ethnicity of STD patients in San Francisco have typically been reported as a single value, with "Hispanic" or "Latino" as a category exclusive of all others. However, in the 2000 and 2010 US Census surveys, race was collected as a multiple-choice item, with Hispanic ethnicity recorded independently of race. In order to make denominators from the census data match totals from case reports, totals for residents reporting more than one race in the census data were divided among totals for residents indicating only one race. Failure to do so would have artificially increased all race-specific rates because there are no patients recorded as "multi-racial" among the STD case reports.

Data for graphics and tables

All numbers presented in the graphics are included in the Appendix at the end or in tables at the end of the section for the graphic. Table cells with fewer than five cases are indicated with an asterisk (*); exact figures are suppressed for confidentiality.

Summary

- Reported early syphilis cases decreased in San Francisco by 3.7 percent from 2017.
- Early syphilis among females increased to 66 cases, which was more than twice the 2017 total of 29. Syphilis cases of any stage among females increased from 62 in 2017 to 111 in 2018. No congenital syphilis cases were reported for the year.
- Gonorrhea cases increased by 2.9 percent from 2017 while chlamydia cases increased by 4.2 percent.
- Among female adolescents and young adults (AYA), gonorrhea cases decreased by 12.5 percent from 2017 and chlamydia cases decreased 3.6 percent; among male AYA, chlamydia cases increased by 8.6 percent; there was no meaningful change in reported gonorrhea cases
- Racial/ethnic disparities for chlamydia and gonorrhea remain large, particularly for adolescents/young adults. In 2018, the rate among Black/African American youth compared to white youth was 5.6 times higher for chlamydia, 4.6 times higher for gonorrhea, and 3.9 times higher for early syphilis.
- Gay and other men who have sex with men have the highest prevalence rates of gonorrhea, chlamydia, and early syphilis. Transgender residents also have higher rates of STD than San Francisco residents as a whole.

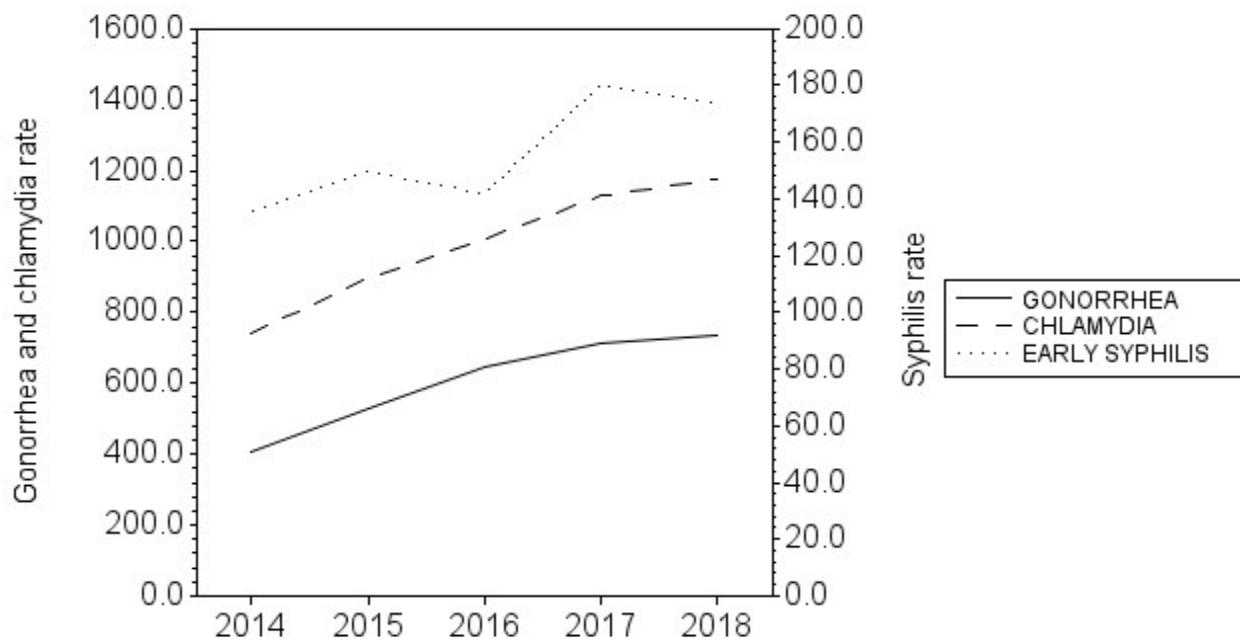

Figure 1. Major reportable STDs, San Francisco, 2014-2018. Note difference in scale for early syphilis.

Table 1. Reportable STD cases and rates, San Francisco, 2014-2018. Rates equal cases per 100,000 residents per year, except for congenital syphilis (cases per 100,000 live births). Note: no cases of late symptomatic (i.e., tertiary) syphilis have been reported since 1992.

¹ cases not known to be less than one year's duration where the patient is 40 years old or less and the initial titer is 1:32 or higher.

Chlamydia

- There were 9465 cases of chlamydia reported among San Francisco residents in 2018, a 4.2 percent increase over 2017. The rate of 1175.4 cases per 100,000 residents per year was the highest ever for San Francisco.
- San Francisco City Clinic accounted for 8.7 percent of the reported chlamydia diagnoses in 2018. Hospitals reported the highest proportion of cases (28.5 percent).
- Nearly 10 percent of chlamydia cases among San Francisco residents in 2018 were reported by providers whose clinics/offices are outside of San Francisco.
- The chlamydia rate for the San Francisco MSA in 2018 was slightly higher than for the state of California, the Los Angles MSA, NYC MSA, and the United States.

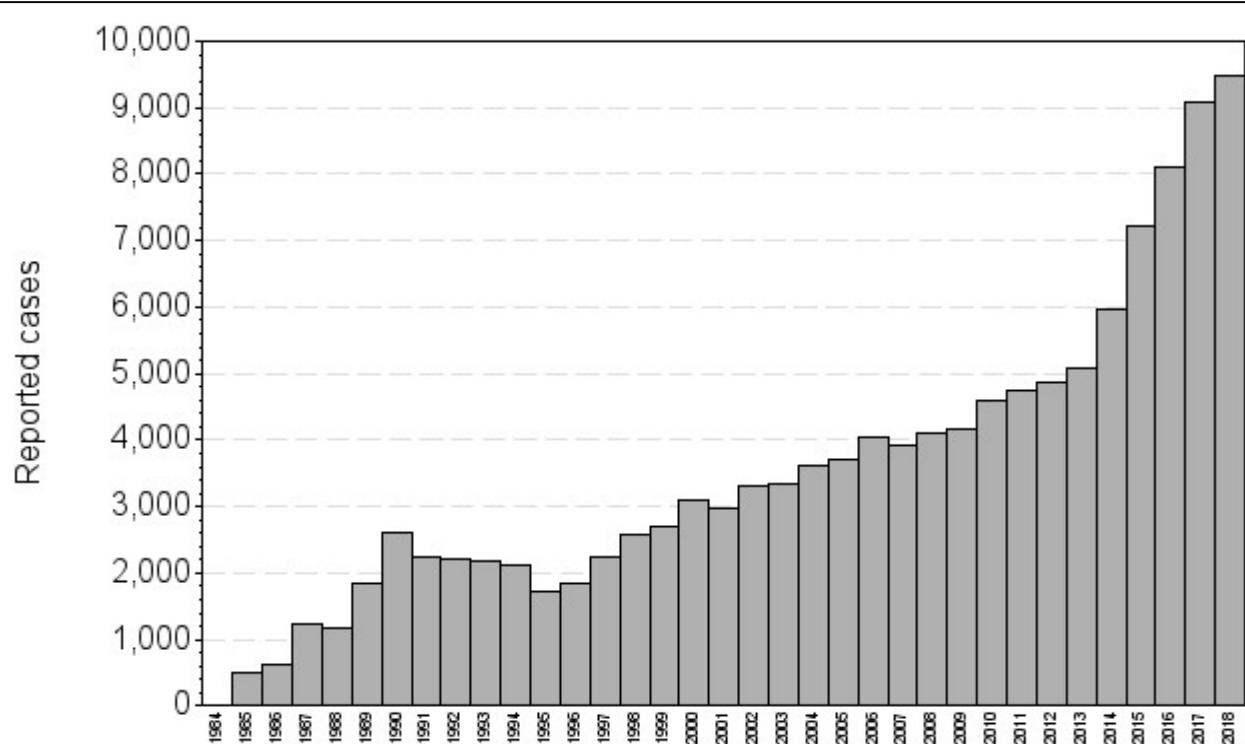

Figure 2. Reported chlamydia cases, San Francisco, 1984-2018. Note: chlamydia became a reportable disease in 1989; the Public Health Laboratory implemented nucleic acid amplification testing in Fall 1996.

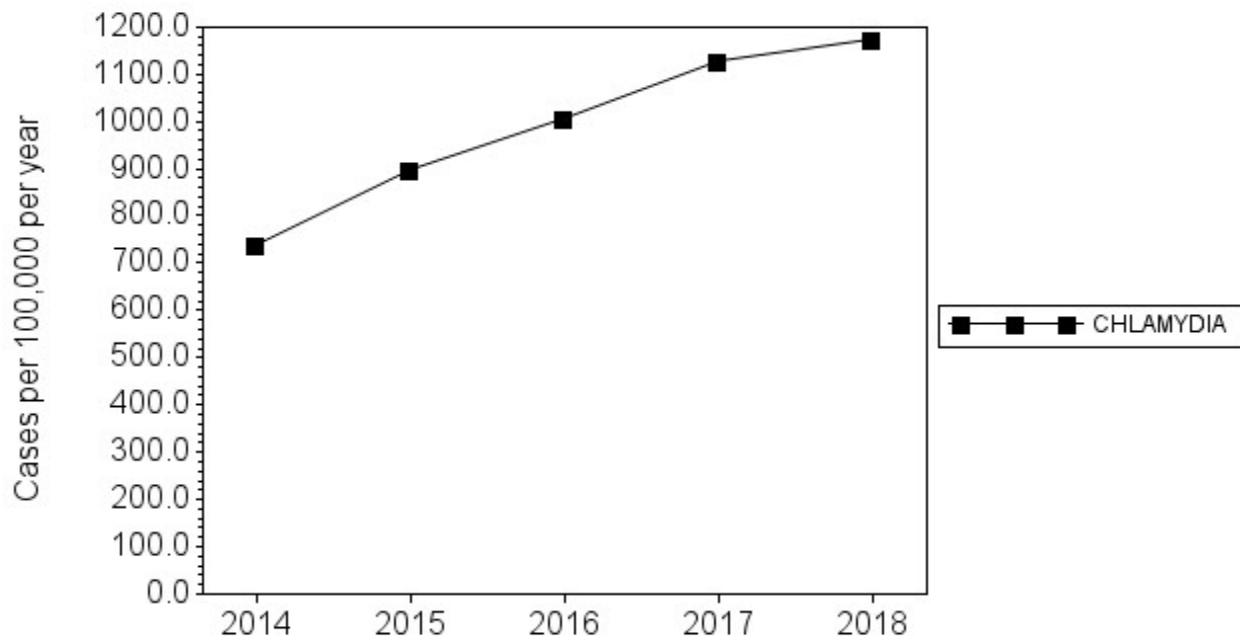

Figure 3. Chlamydia rate, San Francisco, 2014-2018.

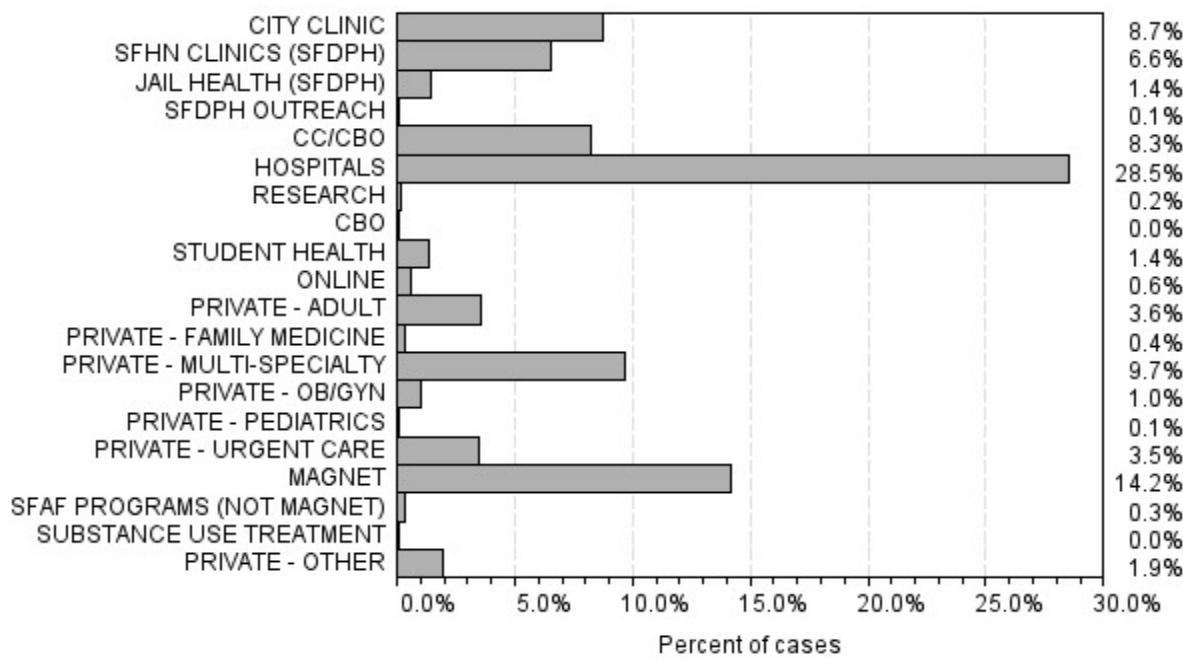

Figure 4. Chlamydia cases by health care provider for 2018. "Jails" includes cases from both adult and adolescent detention facilities. Not included: 899 cases reported by providers outside San Francisco jurisdiction. See Introduction for list of abbreviations used.

Gonorrhea

- There were 5,914 cases of gonorrhea reported among San Francisco residents in 2018, an increase of 2.9 percent over 2017.
- The rate of 734.4 cases per 100,000 residents per year was the highest since 1985.
- San Francisco City Clinic diagnosed 12.4 percent of all reported gonorrhea cases, the lowest proportion ever. Magnet at Strut reported 22.7 percent of cases, an increase from 18.9 percent over 2017.
- Hospitals diagnosed the highest proportion of cases (25.5 percent in 2018).
- Nearly 6.8 percent of gonorrhea cases in 2018 were reported by providers outside San Francisco.
- The gonorrhea rate for the San Francisco MSA in 2018 continued to exceed those for the Los Angeles MSA, the New York MSA, the state of California and the United States as a whole.

Syphilis

- Because many persons with infectious syphilis do not seek medical attention when they have symptoms or are not correctly diagnosed, data on early syphilis (which includes early latent cases) reflects the true incidence of syphilis in the community more accurately than primary and secondary (P&S) syphilis cases alone.
- There were 1,398 cases of early syphilis reported among San Francisco residents in 2018, which was a decrease of 3.7 percent from 2017.
- The early syphilis rate was 173.6 cases per 100,000 residents per year. Of these, 565 were P&S cases, for a P&S rate of 70.2.
- While early syphilis in San Francisco remains a disease predominantly among gay and other men who have sex with men, 66 cases were diagnosed in patients born female, which was more than twice the 30 cases in 2017. The total number of syphilis cases among patients born female increased from 62 in 2017 to 115 in 2018, and increase of 85 percent.
- City Clinic diagnosed 17.3 percent of cases, a decrease from 19.6 percent in 2017, while Magnet diagnosed 16.0 percent, which was nearly unchanged from 2017.
- Early syphilis rates and P&S rates in the San Francisco MSA exceeded those for the New York MSA, the state of California and the United States as a whole in 2018. The increase in the Los Angeles MSA early syphilis rate to 47.7 resulted in the smallest difference from San Francisco since syphilis cases began increasing in 1999.

Congenital syphilis

- No congenital syphilis cases were reported in San Francisco in 2018.
- Of the 66 female early syphilis cases reported in 2018, 2 were pregnant at the time of their diagnosis, while 53 were confirmed to not have been pregnant.¹ The limitations of reporting requirements and surveillance does not enable us to determine the pregnancy status of each female syphilis case or the outcome of each pregnancy.

¹ "Female" cases in this context refers to cases among patients born female, including those who do not identify as female.

Gender

- Chlamydia rates among males remain higher than rates among females, steadily increasing in the past years from a rate ratio of 1.7 in 2014 to 2.3 in 2018. The high rate of chlamydia among men in San Francisco is largely due to the prevalence of rectal and pharyngeal infections among men who have sex with men.
- Gonorrhea cases among females declined by 6.7 percent from 2017 in 2018 while male cases increased 3.9 percent.²
- Reported early syphilis cases in San Francisco in 2018 were 95 percent male. Cases among males declines by 6.6 percent, while cases among females increased by 129 percent.

Race and ethnicity

- Rates of reported STDs vary substantially by race/ethnicity, with Black/African Americans (B/AA) disproportionately affected by chlamydia and gonorrhea.
- Rates for whites, Asian/Pacific Islanders, and Hispanics declined slightly from 2017 or remained nearly the same for all three reportable STDs while rates for Black/African Americans increased for each disease. Rates for Native Americans continue to show high variability from year to year.

Age

- Rates of STDs continued to be highly age-dependent and age-specific rates varied by gender.
- Chlamydia rates continues to be highest for the younger age groups (under 35 years of age), while rates peaked among patients 30-34 years of age for gonorrhea and 30-39 years of age for early syphilis.
- Similar trends for each STD were seen for most age groups. Two exceptions were decreases in gonorrhea among 25-29 year-olds where increases were seen for all other age groups, and increases in early syphilis among those over 55 years of age but decreases in all other ages.
- Chlamydia and gonorrhea rates peak in earlier age groups for females than for males. For early syphilis the age distributions are similar.

Geography

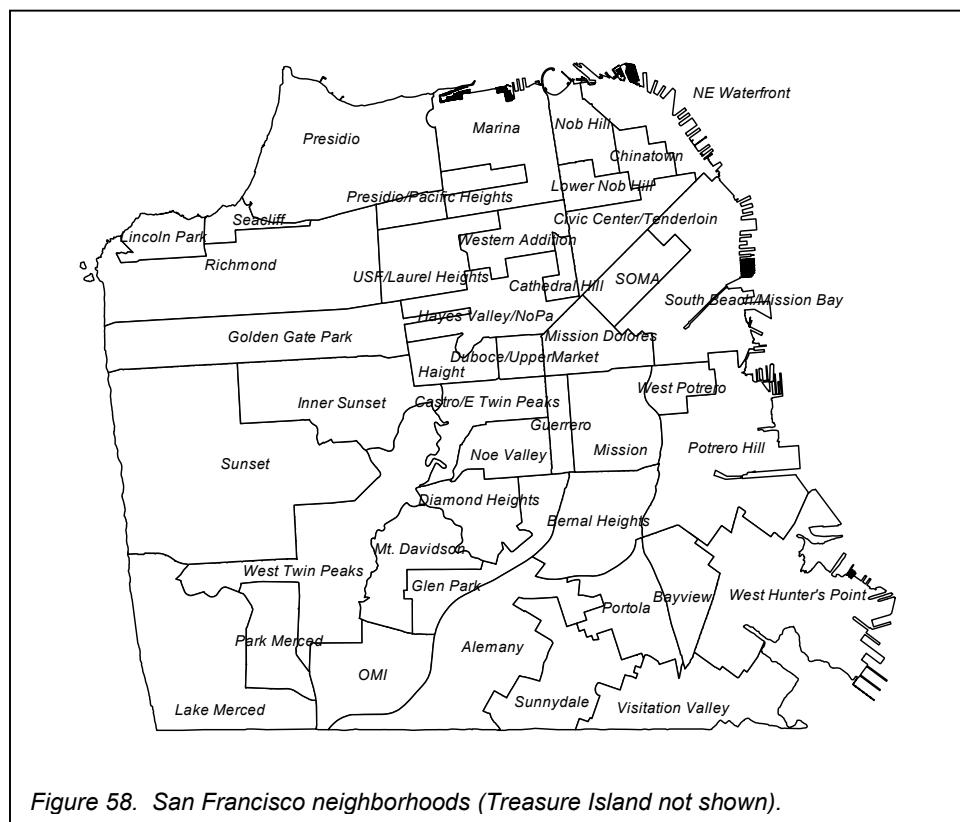

Figure 58. San Francisco neighborhoods (Treasure Island not shown).

approximately 7.7 percent of all gonorrhea and chlamydia reports were missing addresses. Cases that were missing addresses, homeless, or otherwise unable to be assigned to a neighborhood are not included in these geographic analyses but are counted as San Francisco morbidity and included in all other citywide analyses. Note that the rate obtained from combining the rates for each neighborhood will therefore be lower than the actual overall rate for the city.

- High rates of chlamydia continue to be concentrated in two sectors of San Francisco, representing two overlapping epidemics among adolescents of color (southeastern sector of the city) and men who have sex with men (around and between the Castro District and SoMA).
- Gonorrhea rates were highest in the Castro/East Twin Peaks and Duboce Triangle/Upper Market neighborhoods, both having a rate in excess of 3,100 cases per 100,000 residents.
- Syphilis continues to concentrate in the Castro/East Twin Peaks, Duboce Triangle/Upper Market, and Mission Dolores neighborhoods.
- The proportion of total reported STD morbidity among homeless persons increased in 2018. The proportion of early syphilis represented by homeless persons increased from 3.1% in 2017 to 5.7 percent in 2018. Information on housing status is incomplete and the proportion of cases experiencing homelessness or unstable housing is likely underestimated.

Note on maps on following pages: Each map has four ranges of rates. The four ranges are divided by the median, 75th percentile, and 90th percentile of rates for all neighborhoods rounded down to the nearest hundredth. For each map, therefore, the neighborhoods in the lowest range are in the bottom half of rates, while the highest are the top ten percent.

Addresses of cases were grouped into 44 neighborhoods (see Figure 58). Neighborhoods were defined using groups of census tracts that were contiguous on sociodemographic data from the 2010 census and matched to the traditional definitions used by neighborhood residents as much as possible.³

The census tract for each address was determined from computer geocoding. Some addresses were vague or not recognized as valid San Francisco addresses, and therefore could not be assigned to a neighborhood.

Although the law requires addresses to be included in STD reports, they are often missing. In 2018,

³ Neighborhoods were redefined starting with the 2012 Annual Summary. While most remained the same as in the prior reports, some were expanded and others were divided into new neighborhoods. This should be noted when comparing results in this section to geography analyses in annual summaries from before 2012.

Adolescents and Young Adults (persons ages 15 through 25)

- Gonorrhea cases among adolescents and young adults (AYA) decreased from 2017 while adult cases increased. Chlamydia cases increased for both AYA and adults, while early syphilis cases decreased for each group.
- Among female adolescents and young adults (AYA), gonorrhea cases decreased by 12.5 percent from 2017 and chlamydia cases decreased by 3.6 percent. Among male AYA, chlamydia cases increased by 8.6 percent but there was no meaningful change in reported gonorrhea cases.
- The increase in early syphilis rates among females overall was also seen among AYA females; female AYA early syphilis cases increased 117 percent over 2017, while cases among females over 25 years of age increased 132 percent.
- Racial/ethnic disparities for chlamydia and gonorrhea remain large for youth. However, the decrease in gonorrhea cases for youth was mainly due to decreases among Black/African Americans.

Rectal and pharyngeal infections in men

Rectal and pharyngeal screening for gonorrhea and chlamydia for men who have sex with men began in 2001 at City Clinic and has since expanded widely to local providers serving MSM populations. Additionally, local screening guidelines recommend quarterly screening for sexually active gay, bi, and other men who have sex with men. As a result, increases in case detection may partly be a function of increased screening for these often asymptomatic infections. Nearly all rectal and pharyngeal specimens collected were tested for both chlamydia and gonorrhea.

- In 2018, reports of rectal chlamydia and rectal gonorrhea declined slightly. This was the first year with declines since 2009.
- Slightly less than half of male rectal chlamydia and gonorrhea cases were diagnosed among white residents.
- Cases from City Clinic decreased from 2017 while cases from Magnet at Strut increased for both gonorrhea and chlamydia.

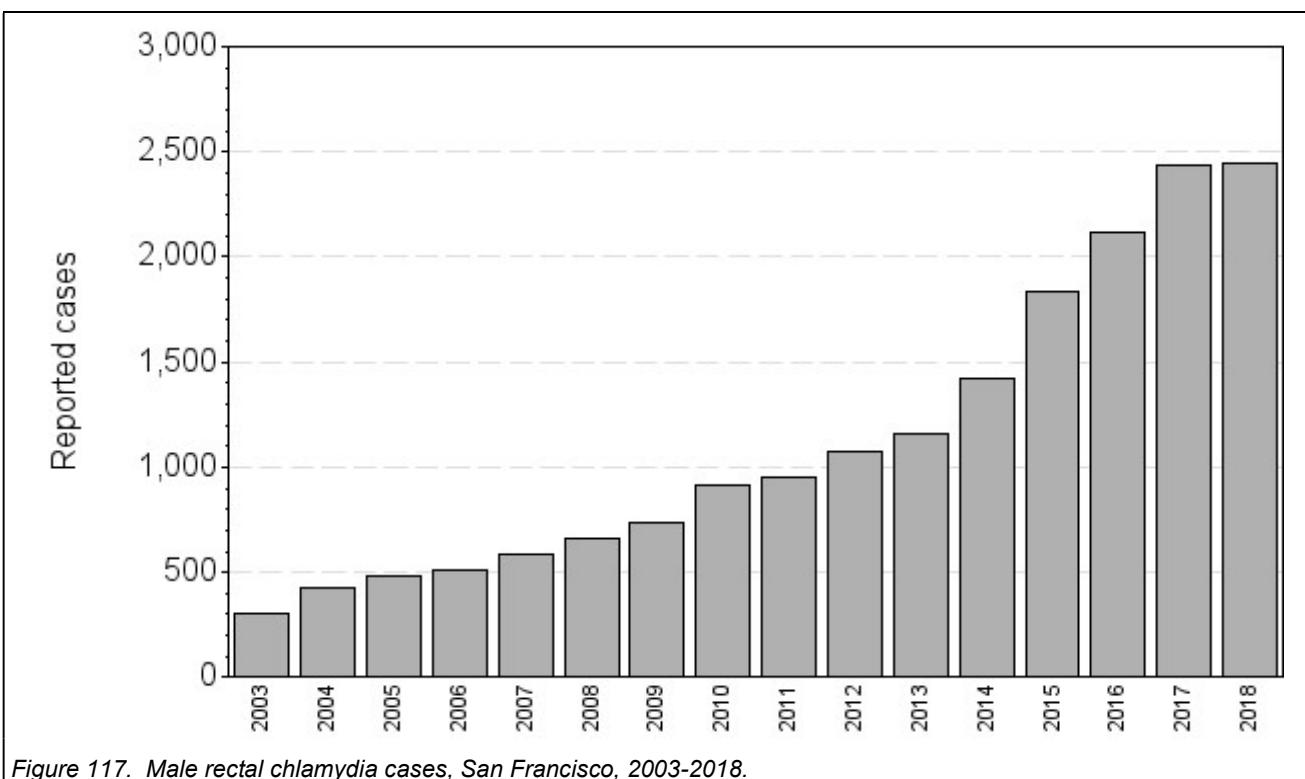

Figure 117. Male rectal chlamydia cases, San Francisco, 2003-2018.

II. City Clinic

The San Francisco City Clinic is the only municipal STD clinic in San Francisco, and provides confidential, state-of-the-art sexual health services to patients twelve years of age or older. The clinic is open five days a week for 36 hours (see City Clinic website www.sfcityclinic.org for exact hours). Visits are primarily drop-in.

The clinic houses a microbiology lab for STAT testing and offers evaluation, testing and on-site treatment for gonorrhea, syphilis, chlamydia, and all other STDs. In addition, the clinic offers STD patients confidential HIV testing, HIV primary care, Pre and Post-Exposure Prophylaxis (PEP and PrEP) for prevention of HIV acquisition, and family planning services for women, including pregnancy testing, Pap smears, contraception, and colposcopy.

Patient demographics

- A total of 8,686 patients were seen at City Clinic in 2018. This was the fourth consecutive year where fewer patients were seen than the previous year.
- The majority were male (77.9 percent), and slightly more than half of male patients identified as gay or bisexual (55.9 percent). Approximately 1.4 percent of patients were either trans female, trans male, or transgender with no further specification.
- There were 16,336 patient-visits in 2018, also a decrease from 2017.
- Over 60 percent of visits were among non-white patients. This proportion of visits among persons of color has increased for each of the past four years.
- San Francisco residents made up 73.1 percent of visits. An increasing proportion of visits are among homeless patients and non-SF Bay Area residents.

STDs at City Clinic

- Fewer cases of chlamydia, gonorrhea, and early syphilis were diagnosed at City Clinic in 2018 than in 2017. Decreases were seen for both male and female patients with the exception of an increase seen in early syphilis cases among women while cases among men decreased.
- LGV cases increased for the fourth consecutive year.
- Prevalence of STDs among gay and bisexual male patients was higher than among other men, women, and other patients.

*Transgender people**

This section of the Annual STD Summary was first included in 2015. The data continue to be very limited, as we continue to work on efforts to improve the quantity and quality of data collected citywide on transgender sexual health.

We include only data of patients seen at San Francisco City Clinic (SFCC) because of the standardized data collection methods on sexual orientation and gender identity (SOGI) at SFCC and the limited reporting of transgender identity from other providers and laboratories.

Patients seen at SFCC are asked to identify their sex at birth and gender at the time of registration; gender identity is also captured during their visit with the clinician. Patients identifying as transgender at registration or with their clinician are included in this section, as are patients whose reported sex at birth is not the same as their current gender identity.

Most laboratories receive limited information on SOGI, and so are unable to include these data when reporting results to SFDPH.

- Trans female, trans male, and other transgender persons made up 1.5% of the total patients and 1.7% of total visits at SFCC in 2018. The majority of transgender patients and visits were among trans females.
- Prevalence of each major STD was highest for trans females. Cis females had the lowest prevalences.
- Few new HIV cases were diagnosed at SFCC in 2018, and the majority were among cis males.

* Terminology Defined:

Transgender: A person whose gender identity differs from the sex that was assigned at birth. May be abbreviated to trans. A **transgender man** (or **trans male**) is someone with a male gender identity and a female birth assigned sex; a **transgender woman** (or **trans female**) is someone with a female gender identity and a male birth assigned sex. A non-transgender person may be referred to as cisgender (*cis*=same side in Latin).

HIV testing

Voluntary, confidential, same-day HIV testing is available to City Clinic patients at no additional cost.

"Behavior risk profile" definitions were changed from previous years in order to align with those used in the San Francisco Department of Public Health's HIV Epidemiology Annual Report (available online: <https://www.sfdph.org/dph/files/reports/default.asp>). Because data on gender of partners is not collected in a way that can be fit to the BRP definitions, patients previously in heterosexual categories are now classified as "Other/unidentified risk".

- The number of HIV tests conducted at City Clinic declined slightly from 2017. The proportion of positive tests also declined slightly, from 0.9 percent in 2017 to 0.8 percent in 2018.
- Of 204 newly diagnosed cases reported in San Francisco in 2018, 27 (13 percent) were identified at City Clinic. These 27 new infections represent 54 percent of the 50 patients who tested positive for HIV at City Clinic in 2018.
- Because these HIV data only represent persons who chose to be tested at City Clinic, and because testing criteria have changed over time, the prevalence measured over time may not represent prevalence and incidence in the greater population of San Francisco residents.

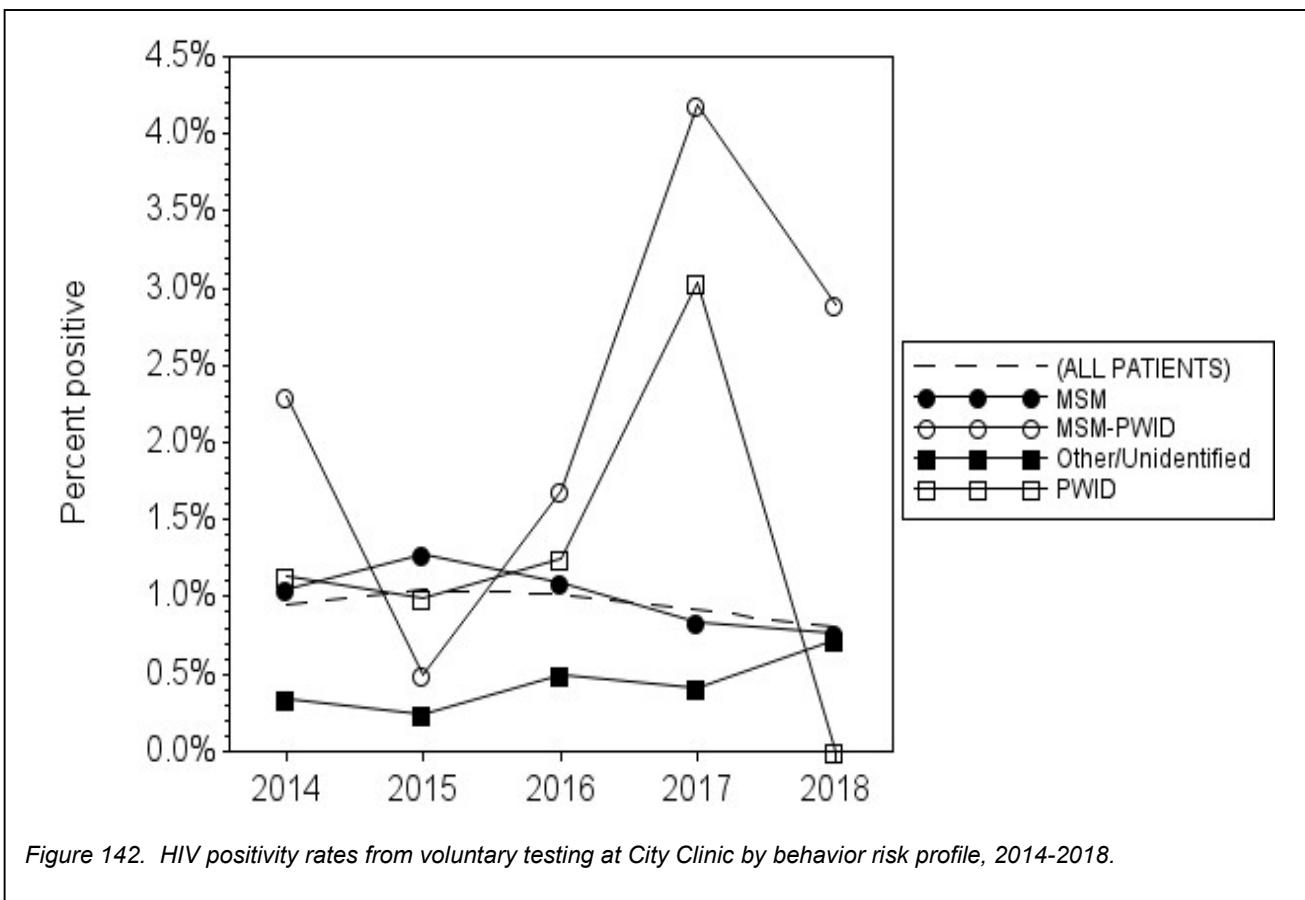

Figure 142. HIV positivity rates from voluntary testing at City Clinic by behavior risk profile, 2014-2018.

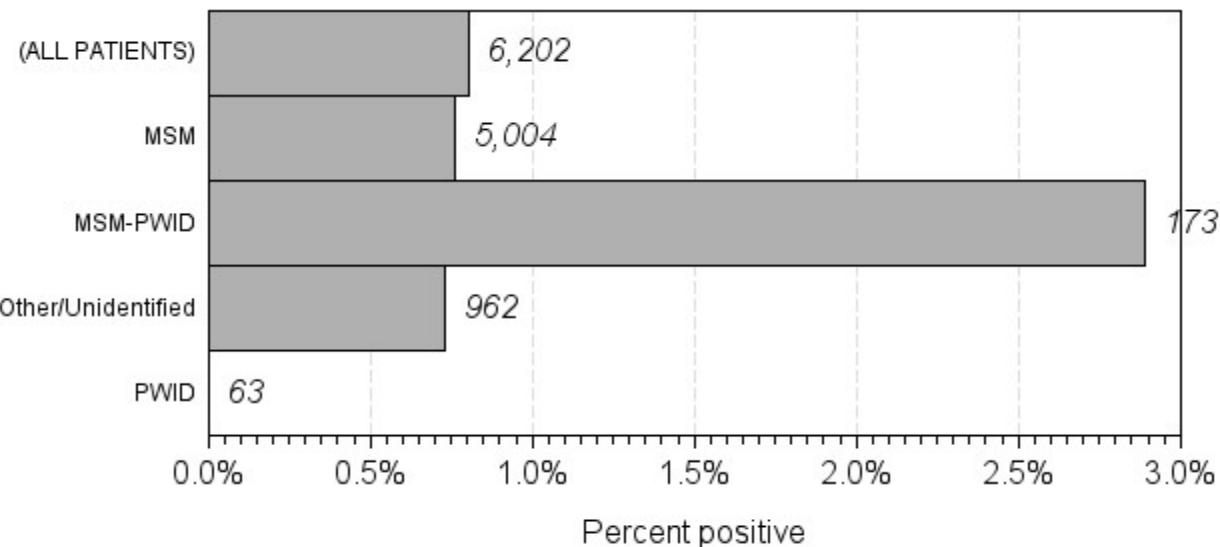

Figure 143. HIV positivity rates from voluntary testing at City Clinic by behavior risk profile for 2018. Number of patients tested in group listed at end of bar.

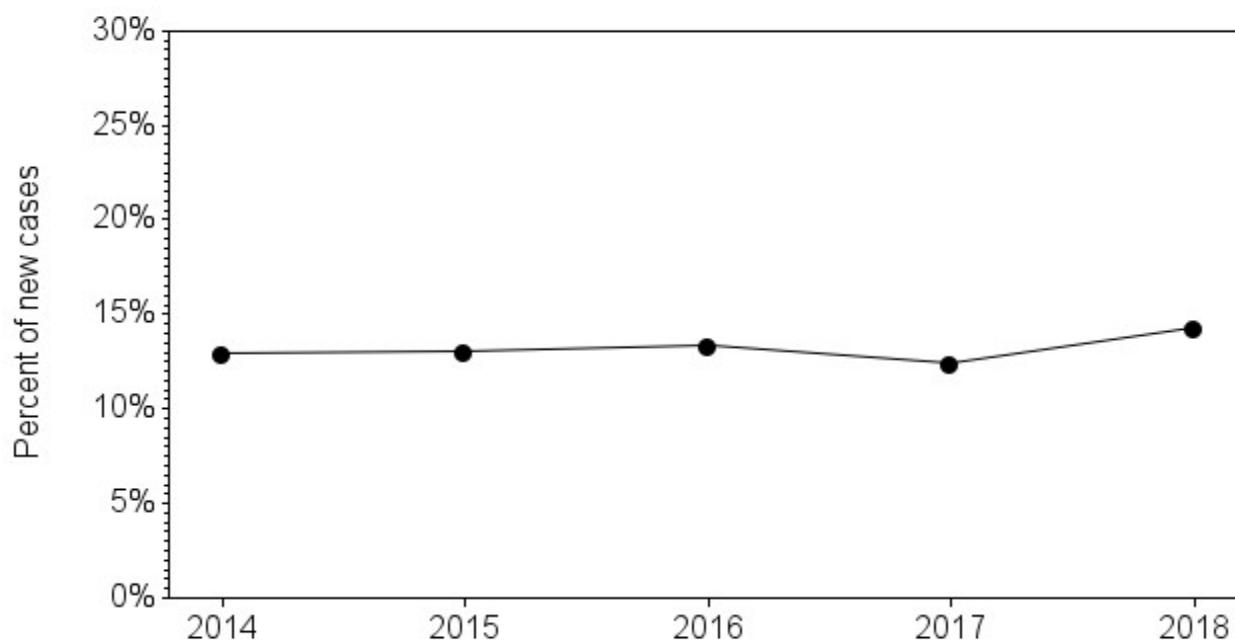

Figure 144. Proportion of all new San Francisco HIV cases identified at City Clinic, 2014-2018.

Table 36. Voluntary HIV test results for STD Control Program, 2014-2018. See list of abbreviations in preface. "Post-test counseled" includes patients informed of their HIV test result.
