

Adult Needs and Strengths Assessment (ANSA) Outcomes

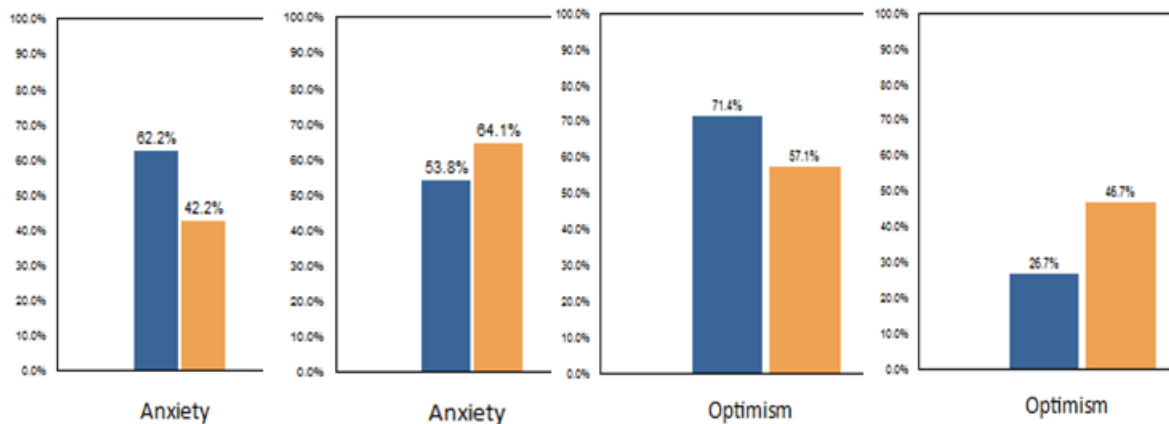

The cohort for this report includes all mental health episodes in which at least 2 ANSAs were completed for the same client. The report compares the two most recent ANSAs, regardless of when they occurred.

Each mental health program has a page devoted to its ANSA results. The top of each page displays the program name and associated RU numbers (some program codes have been "rolled up"). It also displays the average number of days between the two most recent ANSA assessments, the number of episodes with at least 2 ANSA assessments, and the number that showed Reliable Change in each domain. The Reliable Change Index (RCI) is a widely used statistical measure to assess whether meaningful changes have occurred in a treatment cohort.

The remainder of each page is devoted to displaying change in ANSA items among the cohort at the program. Each ANSA item is represented by two clustered bars in a graph. The height of the bars represent the proportion of clients who had Actionable Needs or Available Strengths recorded on the ANSA at two successive assessments.* The right bar in each cluster represents the proportion of clients who had Actionable levels of that Need, or Available levels of that Strength, at the most recent assessment. The left bar represents the proportion at the assessment prior to that. Thus, for Needs, positive change occurred within the cohort of clients when the left bar is higher than the right bar (in that fewer clients have that as an actionable need at Time 2). For Strengths, positive change occurred when the right bar is higher than the left (in that more clients have that strength available to them at Time 2).

This report ONLY considers ANSAs that were submitted as "Final" (not Draft or Pending). The average interval between the assessments is calculated by using the Avatar "submitted as final" timestamp. Programs with 5 or fewer episodes are not displayed. The final page shows overall system results for the total of 12,392 episodes represented.

**Actionable Needs are those that are scored a 2 or 3, except for the Substance Abuse item, for which 1, 2, or 3 are considered Actionable. Available Strengths are those that are rated as a 0 or 1.*

Example of positive change in the cohort on a Need, in that fewer people had Anxiety as an Actionable need at Time 2 (42.2%) than at Time 1 (62.2%)

Example of negative change in the cohort on a Need, in that more people had Anxiety as an Actionable Need at Time 2 (64.1%) than at Time 1 (53.8%).

Example of negative change in the cohort on a Strength, in that fewer people had Optimism as an Available Strength at Time 2 (57.1%) than at Time 1 (71.4%).

Example of positive change in the cohort on a Strength, in that more people had Optimism as an Available Strength at Time 2 (46.7%) than at Time 1 (26.7%).
